(54) LOUDSPEAKER SYSTEM

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a loudspeaker system that is less in time base relation disturbance than that of a conventional technology, can reproduce complicated waveform of low frequencies such as a music tone with fidelity and has a wide service area for a sound field space.
SOLUTION: A loudspeaker enclosure 10 is formed cylindrical and structured such that the enclosure substantially is fixed to cover a loudspeaker unit 1 at an upper side bottom of the cylindrical shape except a front side and a rear side of a diaphragm 4 and has an opening 10c at a lower bottom of the cylindrical shape, and a weight 13 is fixed to the rear of a magnet 2 via support rod 7. This weight 13 acts as a damper and suppresses vibration from the magnet 2 to the support rod 7 by holding the support rod 7 in substantially vertical direction and connecting the magnet 2 acoustically and virtually to the ground.

LEGAL STATUS

[Date of request for examination] 31.05.2000

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]

[Date of final disposal for application]

[Patent number] 3484143

[Date of registration] 17.10.2003
